

Dr. V's 630's Science Weekly Summary
Week of April 2nd 2018

Monday April 2nd: Students received their Microviewer lab back today. We reviewed all the answers and students were encouraged to correct any error or omissions they may have had. We then introduced the various systems in the human body using the Human Body Systems Notes template I provided in GC.

Tuesday April 3rd: Early release at 1 pm. Students received a new GC assignment. We began to fill in the missing terms based on our Integumentary presentation.

Wednesday April 4th: Students completed their notes on the integumentary system.

Thursday April 5th: Students received a handout with an unlabelled skeleton. We added notes about the 5 levels of organization - Cell, Tissue, Organ, Organ System and Complex Organism. In each class we identified an organ and discussed the different tissues that made it possible for this organ to function.

Friday April 6th: Students watched a video on Skeletal system. Students received a fill-in the blanks notes template for the video which they completed in class. A link for the video can be found on my website.

We also conducted an experiment to investigate what lies beneath your skin.
